There are new alternatives to the traditional approach of vein ligation and stripping, including the Venefit™ procedure.

In a comparative multi-center study, the ClosureFast™ catheter was shown to be superior to 980nm endovenous laser in the following areas:

- Less limb pain and bruising
- Fewer complications
- Faster improvement in venous clinical severity scores (VCSS)

The ClosureFast™ catheter ablates the vein in 7 cm segments with 20-sec treatment cycles, resulting in vein shrinkage and occlusion. Data from a prospective, multicenter study have shown 93% vein occlusion 3 years post-treatment.

Do you have patients with VARICOSE VEINS?

If yes, your patients may suffer from venous reflux disease. Venous reflux disease is a progressive condition caused by incompetent vein valves in the leg.

Patient Pain after Procedure

Patient Bruising after Procedure (Moderate to Severe)

• Varicose veins
• Restless legs
• Heaviness and fatigue
• Leg or ankle swelling
• Pain, aching, or cramping
• Burning or itching of the skin
• Skin changes
• Ulcers

The Venefit procedure is a minimally invasive procedure that treats varicose veins and their underlying cause, venous reflux, with little or no pain and can be performed on an outpatient basis using local anesthetic. With ultrasound, the ClosureFast™ catheter is positioned into the diseased vein through a small opening in the skin. The tiny catheter powered by radiofrequency (RF) energy delivers controlled heat to the vein wall causing the collagen in the wall to shrink and the vein to close. Once the diseased vein is closed, blood will re-route itself to healthy veins. The average patient typically resumes normal activities within a few days.

INDICATIONS: The ClosureFast™ catheter is intended for endovascular coagulation of blood vessels in patients with superficial venous reflux.

CONTRAINDICATIONS: Patients with thrombus in the vein segment to be treated. Caution: The vein wall may be thinner in an aneurysmal segment, and the treatment of the vein should include segments proximal and distal to the aneurysmal segment. Caution: No data exists regarding the use of this catheter in patients with documented peripheral arterial disease. The same care should be taken in the treatment of patients with significant peripheral arterial disease as would be taken with a traditional vein ligation and stripping procedure.

POTENTIAL RISKS & COMPLICATIONS: Potential complications include, but are not limited to, the following: vessel perforation, thrombosis, pulmonary embolism, phlebitis, infection, adjacent nerve injury, skin burn, hematoma or discoloration.

Venous reflux disease develops when these valves become dysfunctional and allow retrograde blood flow by incomplete valve closure.

Risk factors for venous insufficiency:
• Age
• Gender
• Obesity
• Family history
• Prolonged standing
• Multiple pregnancies
• Heavy-lifting

Venous reflux disease is progressive — symptoms can worsen over time if left untreated.

Your patients who suffer from venous disease may present symptoms of:
• Varicose veins
• Restless legs
• Heaviness and fatigue
• Leg or ankle swelling
• Pain, aching, or cramping
• Burning or itching of the skin
• Skin changes
• Ulcers

About the Venefit™ procedure

The Venefit procedure is a minimally invasive procedure that treats varicose veins and their underlying cause, venous reflux, with little or no pain and can be performed on an outpatient basis using local anesthetic. With ultrasound, the ClosureFast™ catheter is positioned into the diseased vein through a small opening in the skin. The tiny catheter powered by radiofrequency (RF) energy delivers controlled heat to the vein wall causing the collagen in the wall to shrink and the vein to close. Once the diseased vein is closed, blood will re-route itself to healthy veins. The average patient typically resumes normal activities within a few days.

About the Venefit™ procedure

VENOUS REFLUX DISEASE IS PROGRESSIVE — SYMPTOMS CAN WORSEN OVER TIME IF LEFT UNTREATED.
